

HANDLING MISSING DATA AND DUPLICATE DATA

Missing data: The dataset was checked for missing or null values. No missing values were identified, so no treatment or replacement was required. Using filter dropdown we can check for null or missing values. In view->column quality percentage of empty values is shown. If it shows valid 100%, error 0%, empty 0% there are no missing values.

Duplicate Data: Repeated order ids were found in the Order Details table. However, these records contained different values such as quantity and profit, so they represented separate order-details records rather than duplicate rows. After checking all columns, no exact duplicate rows were found. Therefore, no records were removed. Through Home->Keep rows->Keep duplicates we can verify duplicate rows.
